Education

- **Indian Institute of Technology Indore** — Indore, Madhya Pradesh
  Bachelor of Technology in Electrical Engineering; CGPA: 8.62/10.0 — *Jul 2018 – May 2022*

Experience

- **Rakuten** — Tokyo, Japan
  Senior Software Engineer — *May 2025 – Present*
  - **Technologies**: Java, SpringBoot, SQL, JUnit, JMockit, Karate, JavaScript, Jest, Cypress, AWS, Splunk, Jenkins
  - **PayVault & PayStep (PVPSG)**: Secure payment platform handling credit card storage, tokenization, and a merchant checkout page supporting multiple payment options (Card, PayPal, PostPay, AliPay, etc.).

  Key Achievements

  PayStep — *Backend*
  - Delivered the JID migration (JID retrieves a member's saved credit cards), a 123-file change. Resolved a production-blocking session-deserialization 500 error by deprecating legacy fields and adding V2 fields, keeping the rollout backward-compatible.
  - Hardened security and compliance by removing AWS SES credentials from Git and moving to AWS instance-role access.
  - Designed a zero-downtime key-rotation framework (single key, dual-key grace period, cutover). The design avoided risky production schema changes and spans every payment entry point, deferred flow, batch job, and downstream integration.
  - Onboarded 15+ merchant clients end to end (service config, SQL data, PRO operations). Built a default mail-template feature that removes per-client template work.
  - Owned multiple production releases, preparing release branches, manuals, STG tests, test reports, and PRO paperwork.
  - Investigated Java 21 (Corretto) readiness and produced a dependency-check report.
  - Led the batch redesign investigation and PoC to decouple batch jobs from application releases, which previously doubled release effort. Built the mail-batch PoC on a container and the shared paystep_common module, and evaluated Spring Batch against the current design.

  PayVault JS — *Frontend*
  - Delivered UnionPay card brand support (BIN ranges 62 and 81) with 100% coverage on the card-validation and validator modules, and eliminated critical and high-severity dependency vulnerabilities by migrating off the unmaintained validate.js and upgrading the Node.
  - Resolved a production camera-freeze bug in the card-scan modal on Android. The camera froze when the screen was turned off and the user tapped re-scan, on Android devices. I fixed it by re-initialising the camera stream. I also verified the fix across multiple Android and iOS devices with screen-lock scenarios.
  - Strengthened observability and API integration reliability by improved logging.
  - Owned end-to-end prod release delivery for the SDK. This included release PRs, QA reports, release manuals, cross-device testing (Android, Mac, iPadOS) and Cypress E2E and Jest unit test suites. Unit coverage was improved from around 60% to about 85%.

- **Accenture** — Tokyo, Japan
  Software Engineer — *Nov 2022 – May 2025*
  - **Technologies**: Java, Spring, SQL, Angular, TypeScript, Jenkins
  - **Global Billing System (GBS)**: Billing platform enabling users to manage invoices, while internal teams access audit reports and billing summaries. Payment processing was handled by a separate team.

  Key Achievements

  GBS — *Backend*
  - Optimized batch processing systems, achieving a 30% reduction in processing time, significantly improving operational efficiency.
  - Enhanced application scalability and maintainability by implementing effective exception handling techniques, resulting in a 20% reduction in errors through improved logging.

Core Responsibilities

- Cross-functional team collaboration, full SDLC, code reviews, mentoring junior developers, interviewing candidates.

Skills

Technical Skills

- **Back-End Development**: Java, SpringBoot, SQL, JUnit, JMockit, Karate.
- **Front-End Development**: JavaScript, Angular, TypeScript, Jest, Cypress, HTML, CSS.
- **Deployment, Tools**: AWS, Splunk, Jenkins, Git.
